

C₆₀F₁₇O.OH, the first fluorinated epoxyfullerenol

Adam D. Darwish, Anthony G. Avent and Roger Taylor
The Chemistry laboratory, CPES School, Sussex University,
Brighton BN1 9QJ UK

Oxide derivatives frequently accompany formation of fluorinated fullerenes. Earlier work indicated that the derivatives obtained from C₆₀F₃₆ and C₇₀F_{36/38} and also from a mixture of fluorinated fullerenes were epoxides,¹ though it was not possible to confirm this. Compounds C₆₀F_xO.OH were also evident from mass spectrometry but no structures could be determined. Very recently the first epoxyfullerenols have been characterised.² The formation of fluorinated oxahomofullerenes (ethers) has also been fully demonstrated.³ Through irradiation of a toluene solution of C₆₀F₁₈ in air during 65 h we have now isolated the first fluorofullerene epoxyfullerenol, characterised it fully, and propose a general mechanism for the formation of epoxyfullerenols.
